Human Cytokine 16-Plex ELISA

Catalog No. 51510

- Enables simultaneous quantification of Type I, II & III IFNs and other key innate and adaptive immunity cytokines in a single sample:
 - IFN- α , - β , - γ , - λ ; IL-1 α , -4, -5, -6, -8, -10, -12p70, -13, -15, -17, -23; TNF- α
- Utilizes easy to use 96-well plate-based ELISA technology and only requires a sample volume of 50 μ l per well
- Provides analyte sensitivity to as low as 5 pg/ml
- Achieves reproducible results with < 10% inter and intra-assay CVs in various sample matrices, including autoimmune sera and plasma

Figure 1. Representative standard curves

The Human Cytokine 16-Plex ELISA has been developed to simultaneously quantify 16 human cytokines in a single sample in low volumes of serum, plasma, and tissue culture media. This immunoassay employs an ELISA-based multiplex technology in which 16 distinct capture antibodies are spotted in each well of a 96-well plate in a defined 4x4 array. This ELISA kit provides unique chemiluminescent results on each analyte within a sample and allows for a global understanding of ongoing immune responses in diseases ranging from cancer to autoimmunity.
